VA/DoD Clinical Practice Guidelines

The Veteran’s Affairs and Department of Defense are not sponsors of, affiliated with or endorsers of ICSI or the ICSI COPD work group. The VA/DoD has not reviewed ICSI’s processes for endorsement of guidelines. The following ICSI endorsement and conclusions are solely the consensus of the ICSI COPD work group using the ICSI Endorsement Process.

Please note, the previous ICSI Diagnosis and Management of Chronic Obstructive Pulmonary Disease (COPD) guideline from March 2013 is being retired.
Health Care Guideline:
Diagnosis and Management of Chronic Obstructive Pulmonary Disease (COPD)

Tenth Edition
January 2016

Evidence Grading

Literature Search

The VA/DoD literature search covered the time period from January 1, 2005 to February 2014. ICSI replicated this search to include January 2014 – February 2015.

Additional articles were provided by work group members and discussed by the work group prior to inclusion.

GRADE Methodology

Following a review of several evidence rating and recommendation writing systems, ICSI has made a decision to transition to the Grading of Recommendations Assessment, Development and Evaluation (GRADE) system. GRADE has advantages over other systems including the current system used by ICSI. Advantages include:

• developed by a widely representative group of international guideline developers;
• explicit and comprehensive criteria for downgrading and upgrading quality of evidence ratings;
• clear separation between quality of evidence and strength of recommendations that includes a transparent process of moving from evidence evaluation to recommendations;
• clear, pragmatic interpretations of strong versus weak recommendations for clinicians, patients and policy-makers;
• explicit acknowledgement of values and preferences; and
• explicit evaluation of the importance of outcomes of alternative management strategies.

The VA/DoD document was developed using the GRADE methodology to evaluate the overall quality of the body of evidence (page 8 of Va/DoD guideline).

</thead>
<tbody>
<tr>
<td><strong>Diagnosis and Assessment of COPD</strong></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>#1 – We recommend that spirometry, demonstrating airflow obstruction (post-bronchodilator forced expiratory volume in one second/forced vital capacity $\text{FEV}_1/\text{FVC} &lt; 70%$, with age adjustment for more elderly individuals), be used to confirm all initial diagnoses of chronic obstructive pulmonary disease (COPD).</td>
<td>Strong For</td>
<td>No</td>
<td>Care needs to be exercised when interpreting spirometry in the elderly as the percentages of patients with $\text{FEV}_1/\text{FVC} &lt; 0.7$ rises with age so that about $\frac{1}{2}$ of subjects age 75-85 have a decreased $\text{FEV}_1/\text{FVC}$ ratio ($\text{Chest} \ 2000;117:326S-31S$). In a study of asymptomatic never smokers &gt; 70 years of age, 35% had $\text{FEV}_1/\text{FVC} &lt; 0.7$.</td>
<td>Hardie, 2002; Petty, 2000</td>
</tr>
<tr>
<td>#2 – We have no recommendations regarding the utilization of existing clinical classification systems at this time.</td>
<td>Not Applicable</td>
<td>Yes</td>
<td>#2 dovetails into #3, see below</td>
<td>Goossens, 2014</td>
</tr>
<tr>
<td>#3 – We suggest classification of patients with COPD into two groups: a. Patients who experience frequent exacerbation (two or more/year, defined as prescription of corticosteroids, prescription of antibiotics, hospitalization or emergency department [ED] visit); and b. Patients without frequent exacerbations.</td>
<td>Weak For</td>
<td>Yes</td>
<td>Agree</td>
<td>Gupta, 2014; Hsu, 2013</td>
</tr>
<tr>
<td>Resources: mMRC (Modified Medical Research Council dyspnea scale)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>#4 – We recommend offering prevention and risk reduction efforts including smoking cessation and vaccination. <em>Modified from the 2007 CPG without an updated systematic review of the evidence.</em></td>
<td>Strong For</td>
<td>Yes</td>
<td>Agree</td>
<td>Resource: CDC Vaccination link USPSTF – for current ACIP recommendations on immunizations, <a href="http://www.cdc.gov/vaccines/schedules/index.html">http://www.cdc.gov/vaccines/schedules/index.html</a>. This link goes off-site. Click to read the external link disclaimer.</td>
</tr>
</tbody>
</table>
#5 – We recommend investigating additional comorbid diagnoses particularly in patients who experience frequent exacerbations (two or more/year, defined as prescription of corticosteroids, prescription of antibiotics, hospitalization, or ED visit) using simple tests and decision rules (cardiac ischemia [troponin, electrocardiogram], congestive heart failure [B-type natriuretic peptide (BNP), pro-BNP], pulmonary embolism [D-dimer plus clinical decision rule] and gastroesophageal reflux).

<tr>
<td>#26 – For patients with COPD and anxiety, we suggest consultation with a psychiatrist and/or a pulmonologist to choose a course of anxiety treatment that reduces, as much as possible, the risk of using sedatives/anxiolytics in this population. Modified from the 2007 CPG without an updated systematic review of the evidence.</td>
<td>Weak For</td>
<td>No</td>
<td>For patients with COPD and anxiety, we suggest consultation with a primary care physician, psychiatrist or pulmonologist to choose a course of anxiety treatment. Treating physicians should use caution in prescribing sedatives/anxiolytics for this population.</td>
<td>Abascal-Bolado, 2015; Anxiety and depression, combined with or separate from feelings of severe shortness of breath, should be assessed and concurrently treated to optimize health care utilization and increase QOL for patients with COPD. Blakemore, 2014</td>
</tr>
<tr>
<td>Oxygen Therapy</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>#27 – We recommend providing long-term oxygen therapy (LTOT) to patients with chronic stable resting severe hypoxemia (partial pressure of oxygen in arterial blood [PaO2] &lt; 55 mmHg and/or peripheral capillary oxygen saturation [SaO2] ≤ 88%) or chronic stable resting moderate hypoxemia (PaO2 of 56-59 mmHg or SaO2 &gt; 88% and ≤ 90%) with signs of tissue hypoxia (hematocrit &gt; 55%, pulmonary hypertension or cor pulmonale). Modified from the 2007 CPG without an updated systematic review of the evidence.*</td>
<td>Strong For</td>
<td>Yes</td>
<td>Agree</td>
<td>Resource: 6-Minute Walk Test</td>
</tr>
<tr>
<td>#28 – We recommend that patients discharged home from hospitalization with acute transitional oxygen therapy are evaluated for the need for LTOT within 30-90 days after discharge. LTOT should not be discontinued if patients continue to meet the above criteria. Modified from the 2007 CPG without an updated systematic review of the evidence.*</td>
<td>Strong For</td>
<td>Yes</td>
<td>Agree</td>
<td></td>
</tr>
<tr>
<td>#29 – We suggest against routinely offering ambulatory LTOT for patients with chronic stable isolated exercise hypoxemia in the absence of another clinical indication for supplemental oxygen.</td>
<td>Weak Against</td>
<td>Yes</td>
<td>Agree</td>
<td>Stoller, 2010 Resource: 6-Minute Walk Test</td>
</tr>

<tr>
<td>----------------</td>
<td>-----------------------------</td>
<td>-----------------------------</td>
<td>-------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>#30 – For patients with COPD and hypoxemia and/or borderline hypoxemia (SaO2 &lt; 90%) who are planning to travel by plane, we suggest a brief consultation or an e-consult with a pulmonologist. <em>Modified from the 2007 CPG without an updated systematic review of the evidence.</em></td>
<td>Weak For</td>
<td>No</td>
<td>Airline travel is safe for most patients with COPD. Hypoxemic patients should be evaluated clinically and a decision should be made regarding oxygen requirements. Patients with COPD receiving continuous oxygen at home will require supplementation during flight. Many airlines will allow the use of battery-operated portable oxygen concentrators (POCs) on board during flight. POCs were first approved for use by the FAA in summer 2005. Each airline has its own policy regarding on-board oxygen transport and in-flight oxygen usage. Patients need to contact the airline for their current policies regarding oxygen. • Patients should notify the oxygen supply company two weeks in advance. • Many airlines have their own airline-specific medical form for the clinician to fill out. • POC rentals can be per day/week/month. • Patients should always carry a copy of their oxygen prescription.</td>
<td></td>
</tr>
<tr>
<td>#31 – When other causes of nocturnal hypoxemia have been excluded, we suggest against routinely offering LTOT for the treatment of outpatients with stable, confirmed COPD and isolated nocturnal hypoxemia.</td>
<td>Weak Against</td>
<td>Yes</td>
<td>Agree</td>
<td></td>
</tr>
<tr>
<td>Stable Hypercapnea</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>#32 – In the absence of other contributors (e.g., sleep apnea), we suggest referral for a pulmonary consultation in patients with stable, confirmed COPD and hypercapnea.</td>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| #39 – We recommend that any patient considered for surgery for COPD (lung volume reduction surgery [LVRS] and lung transplant) be first referred to a pulmonologist for evaluation.  
*Modified from the 2007 CPG without an updated systematic review of the evidence.* | Strong For | Yes | Agree |                                |
| **Management of Patients in Acute Exacerbation of COPD** |                           |                              |                         |                                |
| 
| #40 – We recommend antibiotic use for patients with COPD exacerbations who have increased dyspnea and increased sputum purulence (change in sputum color) or volume. | Strong For | Yes | Agree |                                |
| 
| #41 – We suggest basing choice of antibiotic on local resistance patterns and patient characteristics.  
a. First-line antibiotic choice may include doxycycline, trimethoprim/sulfamethoxazole (TMP-SMX), second-generation cephalosporin, amoxicillin, amoxicillin/clavulanate and azithromycin.  
b. Despite the paucity of evidence regarding the choice of antibiotics, we suggest reserving broader spectrum antibiotics (e.g., quinolones) for patients with specific indications such as:  
i. Critically ill patients in the intensive care unit (ICU);  
ii. Patients with recent history of resistance, treatment failure or antibiotic use; and  
iii. Patients with risk factors for health care-associated infections. | Weak For | Yes | Agree | Typical second-generation cephalosporins include cefuroxime, cefaclor and cefprozil. |
<p>|
| #42 – For outpatients with acute COPD exacerbation who are treated with antibiotics, we recommend a five-day course of the chosen antibiotic. | Strong For | Yes | Agree |                                |
|
| #43 – There is insufficient evidence to recommend for or against procalcitonin-guided antibiotic use for patients with acute COPD exacerbations. | Not Applicable | Yes | Agree |                                |</p>

*For additional information please refer to the "Reconciling 2007 CPG Recommendations" section of the Va/DoD guideline (page 9).

Return to Table of Contents
The Aims and Measures section is intended to provide protocol users with a menu of measures for multiple purposes that may include the following:

- population health improvement measures,
- quality improvement measures for delivery systems,
- measures from regulatory organizations such as Joint Commission,
- measures that are currently required for public reporting,
- measures that are part of Center for Medicare Services Clinician Quality Reporting initiative, and
- other measures from local and national organizations aimed at measuring population health and improvement of care delivery.

This section provides resources, strategies and measurement for use in closing the gap between current clinical practice and the recommendations set forth in the guideline.

The subdivisions of this section are:

- Aims and Measures
- Implementation Recommendations
- Implementation Tools and Resources
- Implementation Tools and Resources Table
Aims and Measures

1. Decrease the percentage of COPD patients who have exacerbation requiring emergency department evaluation or hospital admission.

   Measures for accomplishing this aim:
   a. Percentage of COPD patients seen in emergency department for COPD-related exacerbations in one month.
   b. Percentage of COPD patients who require hospital admission/readmission for COPD-related exacerbations in one month.
   c. Percentage of COPD patients with two or more hospitalizations over a 12-month period.

2. Increase the use of spirometry testing in the diagnosis of patients with COPD.

   Measure for accomplishing this aim:
   a. Percentage of patients with a diagnosis of COPD who had spirometry testing to establish COPD diagnosis.

3. Increase the percentage of COPD patients who receive information on the tobacco cessation options and information on the risks of continued smoking.

   Measures for accomplishing this aim:
   a. Percentage of patients with COPD who are asked about smoking and smoking exposure at every visit with clinician.
   b. Percentage of patients with COPD who are smokers who have assessment of readiness to attempt smoking cessation.
   c. Percentage of patients with COPD who are smokers who receive a smoking cessation intervention.
   d. Percentage of patients with COPD and smokers who quit smoking (100% quit-rate goal).

4. Increase the percentage of patients with COPD who have appropriate therapy prescribed.

   Measure for accomplishing this aim:
   a. Percentage of patients with COPD who are prescribed appropriate therapy, including:
      • appropriate vaccinations per CDC schedule
      • long-term oxygen assessment and prescription for long-term home oxygen for those who are hypoxic and meet criteria
      • short-acting bronchodilator (when needed)
      • long-acting bronchodilator (when needed)
      • corticosteroids (when needed)

5. Increase the percentage of patients who have education and management skills with COPD.

   Measure for accomplishing this aim:
   a. Percentage of patients with moderate or severe COPD who have been referred to a pulmonary rehabilitation or exercise program.
6. Increase the percentage of patients with moderate or severe COPD who have health directives in place.

   Measure for accomplishing this aim:
   
   a. Percentage of patients with moderate or severe COPD who have health care directives in place.

Return to Table of Contents
Measurement Specifications

Measure #1a
Percentage of COPD patients seen in emergency room for COPD-related exacerbations in one month.

Population Definition
Patients 18 years and older with COPD diagnosis.

Data of Interest

\[
\frac{\# \text{ of patients seen in emergency room for COPD-related exacerbations}}{\# \text{ of patients with COPD}}
\]

Numerator/Denominator Definitions
Numerator: Number of patients with COPD who are seen in emergency room for COPD-related exacerbations in one month.
Denominator: Number of patients with COPD diagnosis.

Method/Source of Data Collection
Review electronic medical records for all patients with COPD. Review records to determine whether they were seen in the emergency room for COPD-related exacerbations.

Time Frame Pertaining to Data Collection
Monthly.

Notes
This is an outcome measure, and improvement is noted as a decrease in the rate.

Return to Table of Contents
Measure #1b
Percentage of COPD patients who require hospital admission/readmission for COPD-related exacerbations in one month.

Population Definition
Patients 18 years and older with COPD diagnosis.

Data of Interest
\[
\frac{\text{# of patients who were hospitalized for COPD-related exacerbations}}{\text{# of patients with COPD}}
\]

Numerator/Denominator Definitions
Numerator: Number of patients with COPD who were hospitalized for COPD-related exacerbations in one month.
Denominator: Number of patients with COPD diagnosis.

Method/Source of Data Collection
Review electronic medical records for all patients with COPD. Review records to determine whether they were hospitalized during the measurement period for COPD-related exacerbations.

Time Frame Pertaining to Data Collection
Measurement period could be weekly, monthly, quarterly or annual.

Notes
This is an outcome measure, and improvement is noted as a decrease in the rate.

Return to Table of Contents
Measure #1c
Percentage of COPD patients with two or more hospitalizations over a 12-month period.

Population Definition
Patients 18 years and older with COPD diagnosis.

Data of Interest
\[
\frac{\text{# of patients who were hospitalized two or more times}}{\text{# of patients with COPD}}
\]

Numerator/Denominator Definitions
Numerator: Number of patients with COPD who were hospitalized for COPD-related exacerbations two or more times over a 12-month period.
Denominator: Number of patients with COPD diagnosis.

Method/Source of Data Collection
Review electronic medical records for all patients with COPD diagnosis during a 12-month measurement period. Review records to determine whether they were hospitalized during this measurement period for COPD-related exacerbations two or more times.

Time Frame Pertaining to Data Collection
Annually.

Notes
This is an outcome measure, and improvement is noted as a decrease in the rate.

Return to Table of Contents
Measure #2a
Percentage of patients with a diagnosis of COPD who had spirometry testing to establish COPD diagnosis.

Population Definition
Patients 18 years and older with COPD diagnosis.

Data of Interest

\[
\frac{\text{# of patients who had spirometry testing to establish COPD diagnosis}}{\text{# of patients with COPD}}
\]

Numerator/Denominator Definitions
Numerator: Number of patients with COPD who had spirometry testing to establish COPD diagnosis.
Denominator: Number of patients with COPD diagnosis.

Method/Source of Data Collection
Review electronic medical records for all patients with COPD. Review records to determine whether spirometry testing was used to establish COPD diagnosis.

Time Frame Pertaining to Data Collection
Monthly.

Notes
This is a process measure, and improvement is noted as an increase in the rate. Check for quality of spirometry reading on a case-by-case basis.
Measure #3a
Percentage of patients with COPD who are asked about smoking and smoking exposure at every visit with clinician.

Population Definition
Patients age 18 years and older with COPD diagnosis.

Data of Interest
\[
\frac{\text{# of patients with COPD who are asked about smoking and smoking exposure at every visit with clinician}}{\text{# of patients with COPD}}
\]

Numerator/Denominator Definitions
Numerator: Number of patients with COPD who are asked about smoking and smoking exposure at every visit with clinician.
Denominator: Number of patients with COPD.

Method/Source of Data Collection
Review electronic medical records for all patients with COPD. Review records to determine whether patients were asked at every visit with clinician about smoking and smoking exposure.

Time Frame Pertaining to Data Collection
Monthly.

Notes
This is a process measure, and improvement is noted as an increase in the rate.

Return to Table of Contents
Measure #3b

Percentage of patients with COPD who are smokers who have assessment of readiness to attempt smoking cessation.

Population Definition

Patients 18 years and older with COPD diagnosis and smokers.

Data of Interest

\[
\frac{\text{# of patients who have assessment of readiness to attempt smoking cessation}}{\text{# of patients with COPD and smokers}}
\]

Numerator/Denominator Definitions

Numerator: Number of patients with COPD and smokers who have assessment of readiness to attempt smoking cessation.

Denominator: Number of patients with COPD diagnosis and smokers.

Method/Source of Data Collection

Review electronic medical records for all patients with COPD who also smoke. Review records to determine whether they had assessment of readiness to attempt smoking cessation at any time during measurement period.

Time Frame Pertaining to Data Collection

Monthly.

Notes

This is a process measure, and improvement is noted as an increase in the rate.

Return to Table of Contents
**Measure #3c**

Percentage of COPD patients who are smokers who receive a smoking cessation intervention.

**Population Definition**

Patients 18 years and older with COPD diagnosis and smokers.

**Data of Interest**

\[
\text{# of patients who receive a smoking cessation intervention} \quad \frac{\text{# of patients with COPD and smokers}}{}
\]

**Numerator/Denominator Definitions**

Numerator: Number of patients with COPD and smokers who receive a smoking cessation intervention.

Denominator: Number of patients with COPD diagnosis and smokers.

**Method/Source of Data Collection**

Review electronic medical records for all patients with COPD and who are also smokers. Review records to determine whether they received a smoking cessation intervention during measurement period.

**Time Frame Pertaining to Data Collection**

Monthly.

**Notes**

This is a process measure, and improvement is noted as an increase in the rate.

*Return to Table of Contents*
Measure #3d

Percentage of patients with COPD and smokers who quit smoking (100% quit-rate goal).

Population Definition

Patients 18 years and older with COPD diagnosis and smokers.

Data of Interest

\[
\text{# of patients who quit smoking} \quad \frac{\text{# of patients with COPD and smokers}}{}
\]

Numerator/Denominator Definitions

Numerator: Number of patients with COPD and smokers who quit smoking.

Denominator: Number of patients with COPD diagnosis and smokers.

Method/Source of Data Collection

Review electronic medical records for all patients with COPD and who are also smokers. Review records to determine whether they quit smoking at some point of their care.

Time Frame Pertaining to Data Collection

Annually.

Notes

This is an outcome measure, and improvement is noted as an increase in the rate. The target goal for quit rate is 100%.

Return to Table of Contents
Measure #4a

Percentage of patients with COPD who are prescribed appropriate therapy, including:

- appropriate vaccinations per CDC schedule
- long-term oxygen assessment and prescription for long-term home oxygen for those who are hypoxic and meet criteria
- short-acting bronchodilator (when needed)
- long-acting bronchodilator (when needed)
- corticosteroids (when needed)

Population Definition

Patients 18 years and older with COPD diagnosis.

Data of Interest

\[
\frac{\text{# of patients who are prescribed appropriate therapy}}{\text{# of patients with COPD}}
\]

Numerator/Denominator Definitions

Numerator: Number of patients with COPD who are prescribed appropriate therapy, including:

- appropriate vaccinations per CDC schedule
- long-term oxygen assessment and prescription for long-term home oxygen for those who are hypoxic and meet criteria
- short-acting bronchodilator (when needed)
- long-acting bronchodilator (when needed)
- corticosteroids (when needed)

Denominator: Number of patients with COPD diagnosis.

Method/Source of Data Collection

Review electronic medical records for all patients with COPD and determine if they were prescribed an appropriate therapy based on their need.

Time Frame Pertaining to Data Collection

Monthly.

Notes

This is a process measure, and improvement is noted as an increase in the rate.

Return to Table of Contents
Measure #5a

Percentage of patients with moderate or severe COPD who have been referred to a pulmonary rehabilitation or exercise program.

Population Definition

Patients 18 years and older with COPD diagnosis.

Data of Interest

\[
\frac{\text{# of patients referred to a pulmonary rehabilitation or exercise program}}{\text{# of patients with COPD}}
\]

Numerator/Denominator Definitions

Numerator: Number of patients with moderate or severe COPD referred to a pulmonary rehabilitation or exercise program.

Denominator: Number of patients with moderate or severe COPD.

Method/Source of Data Collection

Review electronic medical records for all patients with moderate or severe COPD diagnosis during measurement period. Determine whether patients were referred to a pulmonary rehabilitation or exercise program at any time.

Time Frame Pertaining to Data Collection

Monthly.

Notes

This is a process measure, and improvement is noted as an increase in the rate.
Measure #6a
Percentage of patients with moderate or severe COPD who have health care directives in place.

Population Definition
Patients 18 years and older with COPD diagnosis.

Data of Interest
\[
\frac{\text{# of patients who have health care directives in place}}{\text{# of patients with moderate or severe COPD}}
\]

Numerator/Denominator Definitions
Numerator: Number of patients with moderate or severe COPD who have health care directives in place.
Denominator: Number of patients with moderate or severe COPD.

Method/Source of Data Collection
Review electronic medical records for all patients with moderate or severe COPD. Determine whether patients have health care directives in place.

Time Frame Pertaining to Data Collection
Monthly.

Notes
This is a process measure, and improvement is noted as an increase in the rate.
Implementation Recommendations

Prior to implementation, it is important to consider current organizational infrastructure that address the following:

- System and process design
- Training and education
- Culture and the need to shift values, beliefs and behaviors of the organization. In addition, this document was developed for the VA system and may not always be generalizable to all health care systems.

Return to Table of Contents

Implementation Tools and Resources

Criteria for Selecting Resources

The following tools and resources specific to the topic of the guideline were selected by the work group. Each item was reviewed thoroughly by at least one work group member. It is expected that users of these tools will establish the proper copyright prior to their use. The types of criteria the work group used are:

- The content supports the clinical and the implementation recommendations.
- Where possible, the content is supported by evidence-based research.
- The author, source and revision dates for the content are included where possible.
- The content is clear about potential biases and when appropriate conflicts of interests and/or disclaimers are noted where appropriate.

ICSI Shared Decision-Making Model

The Collaborative Conversation™ Shared Decision-Making and the Translation of Evidence into Practice

A consistent finding from clinical and health services research is the failure to translate research into practice. The translation of evidence into practice can be advanced through the use of shared decision-making since shared decision-making results in evidence being incorporated into patient and clinician consultations.

Shared decision-making (SDM) is a process in which patient and clinicians collaborate to clarify all acceptable options, ensure that the patient is well-informed and chose a course of care consistent with patient values and preferences and the best available medical evidence. (Minnesota Shared Decision-Making Collaborative [MSDMC], 2011).

Evidence-based guidelines may recommend the use of shared decision-making for decisions in instances where the evidence is equivocal, when patient action or inaction (such as medication adherence or lifestyle changes) can impact the potential outcome, or when the evidence does not indicate a single best recommendation.

SDM is a patient-centered approach that involves a conversation between the patient and the clinician. It is ideal to involve caregivers and family members in these conversations as well. Family members and caregivers can participate in discussions, ask questions, hear content the patient may miss and provide invaluable support in decision follow-through. Although only patients and clinicians are specifically mentioned throughout this document for brevity purposes, this does not diminish the importance of caregivers and families in patient-centered care.

Both the patient and the clinician bring expertise to the shared decision-making conversation. Clinicians’ expertise includes disease etiology, prognosis, options for treatment including the burden and benefit to the patient, and outcome probabilities. Patients’ expertise lies in their knowledge of their risk tolerance, body, priorities, family and financial issues, as well as their daily experience with the condition (adapted from Making Shared Decision-Making a Reality. No decision about me, without me. Coulter, A., Collins, A., The King’s Fund 2011).

Treatment options vary in their burden on a patient. SDM offers an opportunity to help the patient select a treatment to which they can adhere. When conversations discussing options occurs, patients and clinicians are actively engaged while considering the attributes and issues of the available options. This empathic approach results in the clinician and patient co-creating a decision and a plan of care (adapted from Montori, V., the Mayo Clinic KER UNIT, April 2015). Decision aids can be supportive of this conversation when they communicate the best available evidence to inform the patient and clinician discussion.

Without a conversation, clinicians may make assumptions about what the patient prefers. This creates the potential for discrepancies between what clinicians assume and what patients want, resulting in a “preference misdiagnosis” (adapted from Health Policy Publishing, LLC, May 2013).

Difficulty in initiating a conversation is cited by patients and clinicians as one of the barriers to shared decision-making. To address this impediment, ICSI worked with patients, practicing clinicians, and other stakeholders to develop the Collaborative Conversation™ model for use across the care continuum.
Collaborative Conversation™

A collaborative approach towards decision-making is a fundamental tenet of Shared Decision-Making (SDM). The Collaborative Conversation™ is an interprofessional approach that nurtures relationships; enhances patients’ knowledge, skills and confidence as vital participants in their health; and encourages them to manage their health care. Within a Collaborative Conversation™, the perspective is that the patient, rather than the clinician, knows which course of action is most consistent with the patient’s values and preferences.

Use of Collaborative Conversation™ elements and tools is even more necessary to support patient, care clinician and team relationships when patients and families are dealing with high stakes or highly charged issues. A diagnosis of a life-limiting illness is one example of such a circumstance.

The overall objective for the Collaborative Conversation™ approach is to create an environment in which the patient, family and care team work collaboratively to reach and carry out a decision that is consistent with the patient’s values and preferences, along with the best available evidence. A rote script, completed form or checklist does not constitute this approach. Rather it is a set of skills employed appropriately for the specific situation. These skills need to be used artfully to address all aspects of the person involved in making a decision: cognitive, affective, social and spiritual.

Key communication skills help build the collaborative conversation approach. These skills include (Adapted from O’Connor, Jacobsen Decisional Conflict: Supporting People Experiencing Uncertainty about Options Affecting their Health [2007], and Bunn H, O’Connor AM, Jacobsen MJ Analyzing decision support and related communication [1998, 2003])

1. **Listening skills**

   - **Encourage** patient to talk by providing prompts to continue such as *go on, and then? and uh huh* or by repeating the last thing a person said, *It’s confusing*.

   - **Paraphrase content of messages shared by patient** to promote exploration, clarify content and to communicate that the person’s unique perspective has been heard. The clinician should use their own words rather than just parroting what they heard.

   - **Reflection of feelings** usually can be done effectively once trust has been established. Until the clinician feels that trust has been established, short reflections at the same level of intensity expressed by the patient without omitting any of the message’s meaning are appropriate. Reflection in this manner communicates that the clinician understands the patient’s feelings and may work as a catalyst for further problem solving. For example, the clinician identifies what the person is feeling and responds back in his or her own words like this: *“So, you’re unsure which choice is the best for you.”*

   - **Summarize the person’s key comments** and reflect them back to the patient. The clinician should condense several key comments made by the patient and provide a summary of the situation. This assists the patient in gaining a broader understanding of the situation rather than getting mired down in the details. The most effective times to do this are midway through and at the end of the conversation. An example of this is *“You and your family have read the information together, discussed the pros and cons, but are having a hard time making a decision because of the risks.”*

   - **Perception checks** ensure that the clinician accurately understands a patient or family member perspective, and may be used as a summary or reflection. They are used to verify that the clinician is interpreting the message correctly. The clinician can say, *“So you are saying that you’re not ready to make a decision at this time. Am I understanding you correctly?”*

*Return to Table of Contents*
2. Questioning Skills

Open and closed questions are both used, with the emphasis on open questions. Open questions ask for clarification or elaboration and cannot have a yes or no answer. An example would be, “What else would influence you to choose this?” Closed questions are appropriate if specific information is required, such as “Does your daughter support your decision?”

Other skills such as summarizing, paraphrasing, and reflection of feeling can be used in the questioning process so that the patient doesn’t feel pressured by questions.

Verbal tracking, referring back to a topic the patient mentioned earlier, is an important foundational skill (Ivey & Bradford-Ivey). An example of this is the clinician saying, “You mentioned earlier…”

3. Information-Giving Skills

Providing information and providing feedback are two methods of information giving. The distinction between providing information and giving advice is important. Information giving allows a clinician to supplement his or her knowledge and helps to keep the conversation patient centered. Giving advice, on the other hand, takes the attention away from the patient’s unique goals and values, and places it on those of the clinician.

Providing information can be sharing facts or responding to questions. An example is “If we look at the evidence, the risk is…” Providing feedback gives the patient the clinician’s view of the patient’s reaction. For instance, the clinician can say, “You seem to understand the facts and value your daughter’s advice.”

When to Initiate a Collaborative Conversation™

Certain seminal events occur along the care continuum, creating especially opportune times for collaborative conversations. More than one of these opportunities may present at a time, and they will occur in no specific order.
Cues for the Care Team to Initiate a Collaborative Conversation™:

- Life goal changes: Patient’s priorities change related to things the patient values such as activities, relationships, possessions, goals and hopes, or things that contribute to the patient’s emotional and spiritual well-being.

- Diagnosis/prognosis changes: Additional diagnoses, improved or worsening prognosis.

- Change or decline in health status: Improving or worsening symptoms, change in performance status or psychological distress.

- Change or lack of support: Increase or decrease in caregiver support, change in caregiver, change in caregiver status, change in financial standing, difference between patient and family wishes.

- Disease progression: Change in physical or psychological status as a result of the disease progression.

- Clinician/caregiver contact: Each contact between the clinician/ caregiver presents an opportunity to reaffirm with the patient that the care plan and the care he or she is receiving are consistent with his or her values.

Patient and Family Needs within a Collaborative Conversation™

- Request for support and information: Decisional conflict is indicated by, among other things, the patient verbalizing uncertainty or concern about undesired outcomes, expressing concern about choice consistency with personal values, or exhibiting behavior such as wavering, delay, preoccupation, distress or tension. Support resources may include health care professionals, family, friends, support groups, clergy and social workers. When patient expresses a need for information regarding options and their potential outcomes, the patient should understand the key facts about the options, risks and benefits, and have realistic expectations. The method and pace with which this information is provided to the patient should be appropriate for the patient’s capacity at that moment.

- Advance Care Planning: With the diagnosis of a life-limiting illness, conversations around advance care planning open up. This is an opportune time to expand the scope of the conversation to other types of decisions that will need to be made as a consequence of the diagnosis of a life-limiting illness.

- Consideration of Values: The personal importance a patient assigns potential outcomes must be respected. If the patient is unclear how to prioritize his or her preferences, value clarification can be achieved through the use of decision aids, detailing the benefits and harms of potential outcomes in terms of how they will directly affect the patient, and through collaborative conversations with the clinician.

- Trust: The patient must feel confident that his or her preferences will be communicated to and respected by all caregivers.

- Care Coordination: Should the patient require care coordination, this is an opportune time to discuss the other types of care-related decisions that need to be made. These decisions will most likely need to be revisited often. Further, the care delivery system must be capable of delivering coordinated care throughout the continuum of care.

- Responsive Care System: The care system needs to support the components of patient- and family-centered care so the patient’s values and preferences are incorporated into the care he or she receives throughout the care continuum.
The Collaborative Conversation™ Map is the heart of this process. The Collaborative Conversation Map™ can be used as a stand-alone tool that is equally applicable to clinicians and patients, as shown in Table 2. Clinicians use the map as a clinical workflow. It helps get the shared decision-making process initiated and provides navigation for the process. Care teams can use the Collaborative Conversation™ to document team best practices and to formalize a common lexicon. Organizations can build fields from the Collaborative Conversation™ Map in electronic medical records to encourage process normalization. Patients use the map to prepare for decision-making, to help guide them through the process and to share critical information with their loved ones.

Table 2

Return to Table of Contents
Evaluating Shared Decision-Making

It has proven challenging to assess shared decision-making. Measuring shared decision-making remains important for continued adoption of shared decision-making as a mechanism for translating evidence into practice; promoting patient-centered care; and understanding the impact of shared decision-making on patient experience, outcomes and revenues. Many assessments exist, but they are often proxy measures.

Two suggested methods for measuring shared decision-making are the CollaboRATE tool and the SURE Test. These two tools measure different aspects of shared decision-making, as described below.

The CollaboRATE tool measures the level of shared decision-making in the clinical encounter from the patient’s perspective. It is a brief patient-reported measure of shared decision-making. The tools and guidance on their use can be found at http://www.collaboratescore.org/.

The SURE Test is a brief screening questionnaire the patient uses to access his or her readiness and capacity to make a decision or to determine whether he or she is comfortable with the choice that was made. In other words, it provides information on how likely a patient may be experiencing decisional conflict. If the SURE Test indicates decisional conflict may exist, the Decisional Conflict Scale should be completed in order to assess clinically significant decisional conflict.

Shared decision-making is a useful mechanism for translating evidence into practice. While research on the impacts of shared decision-making continues to grow, there is mounting evidence that both patients and clinicians benefit from SDM. Shared decision-making offers the opportunity to bring evidence and the patient’s values into the patient/clinician discussion of health choices.

Return to Table of Contents
ICSI has long had a policy of transparency in declaring potential conflicting and competing interests of all individuals who participate in the development, revision and approval of ICSI guidelines and protocols.

In 2010, the ICSI Conflict of Interest Review Committee was established by the Board of Directors to review all disclosures and make recommendations to the board when steps should be taken to mitigate potential conflicts of interest, including recommendations regarding removal of work group members. This committee has adopted the Institute of Medicine Conflict of Interest standards as outlined in the report, *Clinical Practice Guidelines We Can Trust* (2011).

Where there are work group members with identified potential conflicts, these are disclosed and discussed at the initial work group meeting. These members are expected to recuse themselves from related discussions or authorship of related recommendations, as directed by the Conflict of Interest committee or requested by the work group.

**Funding Source**

The Institute for Clinical Systems Improvement provided the funding for this guideline revision. ICSI is a not-for-profit quality improvement organization based in Bloomington, Minnesota. ICSI's work is funded by the annual dues of the member medical groups and three sponsoring health plans in Minnesota. Individuals on the work group are not paid by ICSI but are supported by their medical group for this work.

ICSI facilitates and coordinates the guideline development and revision process. ICSI, member medical groups and sponsoring health plans review and provide feedback but do not have editorial control over the work group. All recommendations are based on the work group's independent evaluation of the evidence.

ICSI Document Development and Revision Process

Overview

Since 1993, the Institute for Clinical Systems Improvement (ICSI) has developed more than 60 evidence-based health care documents that support best practices for the prevention, diagnosis, treatment or management of a given symptom, disease or condition for patients.

Audience and Intended Use

The information contained in this ICSI Health Care Guideline is intended primarily for health professionals and other expert audiences.

This ICSI Health Care Guideline should not be construed as medical advice or medical opinion related to any specific facts or circumstances. Patients and families are urged to consult a health care professional regarding their own situation and any specific medical questions they may have. In addition, they should seek assistance from a health care professional in interpreting this ICSI Health Care Guideline and applying it in their individual case.

This ICSI Health Care Guideline is designed to assist clinicians by providing an analytical framework for the evaluation and treatment of patients, and is not intended either to replace a clinician’s judgment or to establish a protocol for all patients with a particular condition.

Document Development and Revision Process/Endorsement Process

The development process is based on a number of long-proven approaches and is continually being revised based on changing community standards. The ICSI staff, in consultation with the work group and a medical librarian, conduct a literature search to identify systematic reviews, randomized clinical trials, meta-analysis, other guidelines, regulatory statements and other pertinent literature. This literature is evaluated based on the GRADE methodology by work group members. When needed, an outside methodologist is consulted.

The work group uses this information to develop or revise clinical flows and algorithms, write recommendations, and identify gaps in the literature. The work group gives consideration to the importance of many issues as they develop the guideline. These considerations include the systems of care in our community and how resources vary, the balance between benefits and harms of interventions, patient and community values, the autonomy of clinicians and patients and more. All decisions made by the work group are done using a consensus process.

ICSI’s medical group members and sponsors review each guideline as part of the revision process. They provide comment on the scientific content, recommendations and implementation strategies. This feedback is used by and responded to by the work group as part of their revision work. Final review and approval of the guideline is done by ICSI’s Committee on Evidence-Based Practice. This committee is made up of practicing clinicians and nurses, drawn from ICSI member medical groups.

Implementation Recommendations and Measures

These are provided to assist medical groups and others to implement the recommendations in the guidelines. Where possible, implementation strategies are included that have been formally evaluated and tested. Measures are included that may be used for quality improvement as well as for outcome reporting. When available, regulatory or publicly reported measures are included.

Document Revision Cycle

Scientific documents are revised as indicated by changes in clinical practice and literature. ICSI staff monitors major peer-reviewed journals for any pertinent evidence that would affect a particular guideline and recommendation.
